

ASSIGNMENT -1

| | |
|--------------|----------------------------------|
| NAME | NALINA.T |
| PROJECT NAME | VACCINE TRACKING- TRANSPARENT |
| TEAM ID | NM2023TMID01594 |

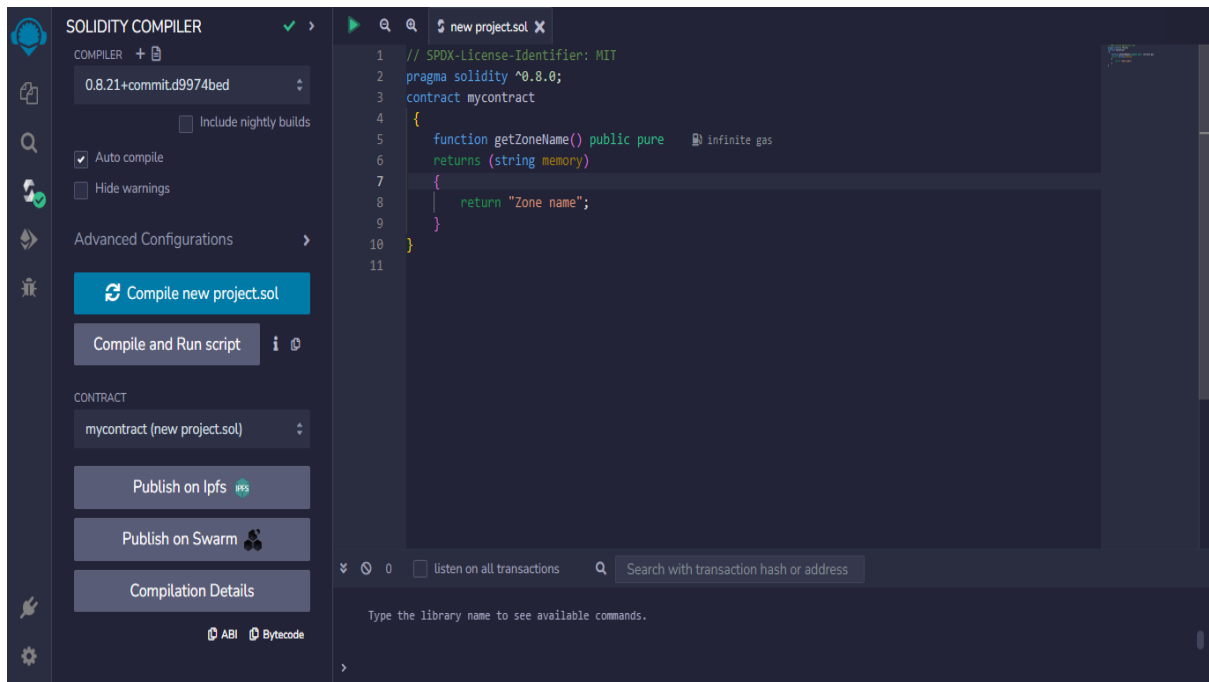

1.Go to the chrome and open remix platform

2.Open the remix page and create a new file

3.In that newly created file, create a program to return your string, "Zone name"

Program:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.13;
contract mycontract
{
    function getZoneName() public pure
    returns (string memory)
    {
        return "Zone name";
    }
}
```

4. Save the program and compile it to get the ABI and Bytecode

ABI:

```
[
  {
    "inputs": [],
    "name": "getZoneName",
    "outputs": [
      {
        "internalType": "string",
        "name": "",
        "type": "string"
      }
    ],
    "stateMutability": "pure",
    "type": "function"
  }
]
```

Bytecode:

608060405234801561001057600080fd5b50610173806100206000396000f3fe6

5.Finally Deploy it to display the output

The screenshot displays the Remix IDE interface. On the left, the 'DEPLOY & RUN TRANSACTIONS' sidebar is active, showing the contract 'mycontract - new project.sol' and a 'Deploy' button. Below the deployment section, the 'Deployed Contracts' list shows 'MYCONTRACT AT 0XD91...39138' with a 'getZoneName' button. The 'Low level interactions' section shows the 'CALLDATA' field. The main editor displays the Solidity code for 'mycontract', which includes a 'getZoneName' function. The bottom right pane shows the transaction details for a call to 'mycontract.getZoneName()', including the 'from' address, 'to' address, 'execution cost' (715 gas), 'input' data, 'decoded input' (empty), 'decoded output' (a JSON object with 'b': 'string: Zone name'), and 'logs'.
