

ASSIGNMENT -1

NAME	HARIDHA.M
PROJECT NAME:	VACCINE TRACKING-TRANSPARENT
TEAM ID	NM2023TMID01594

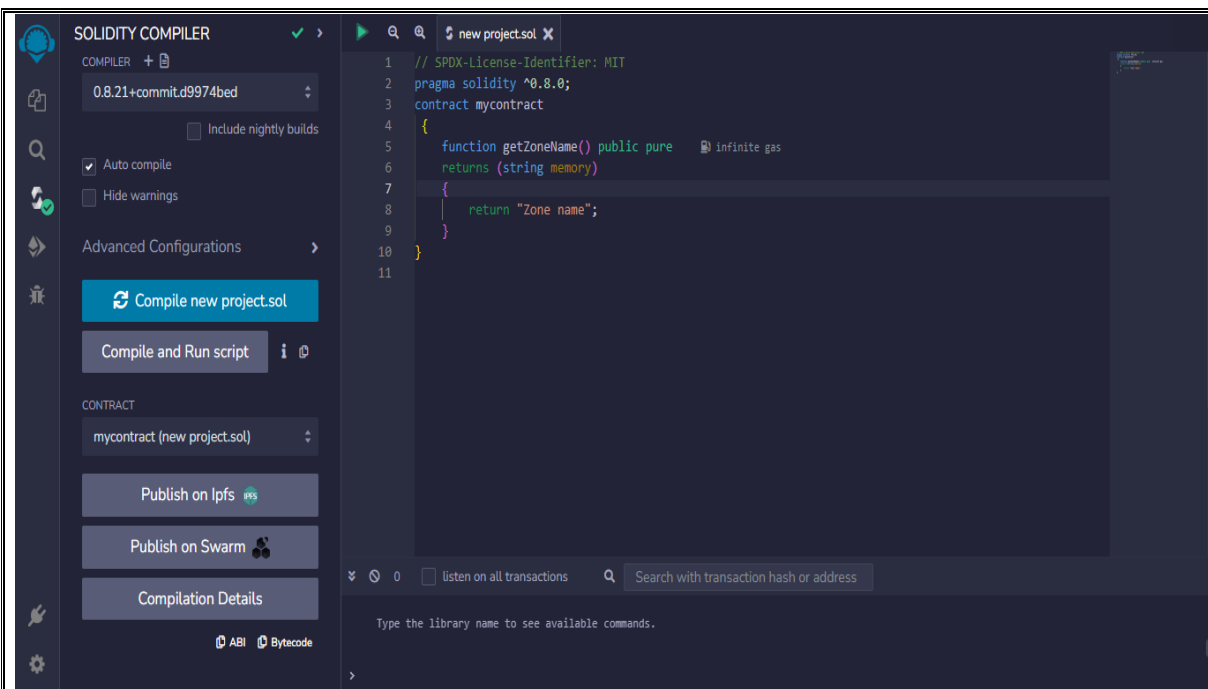

1.Go to the chrome and open remix platform

2.Open the remix page and create a new file

3.In that newly created file, create a program to return your string, "Zone name"

Program:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.13;
contract mycontract
{
function getZoneName() public pure
returns (string memory)
{
return "Zone name";
}
}
```

4. Save the program and compile it to get the ABI and Bytecode

ABI:

```
[
{
"inputs": [],
"name": "getZoneName",
"outputs": [
{
"internalType": "string",
"name": "",
"type": "string"
}
],
"stateMutability": "pure",
"type": "function"
}
```

Bytecode:

608060405234801561001057600080fd5b50610173806100206000396000f3fe60806040523

5.Finally Deploy it to display the output

The screenshot displays the Remix IDE interface. On the left, the 'DEPLOY & RUN TRANSACTIONS' sidebar shows the contract 'mycontract - new project.sol' with the 'evm version: paris' and a 'Deploy' button. Below this, the 'Transactions recorded' and 'Deployed Contracts' sections are visible. The 'Deployed Contracts' section shows 'MYCONTRACT AT 0XD91...39138' with a 'getZoneName' button. The 'Low level interactions' section shows 'CALLDATA' and a 'Transact' button. The main editor displays the Solidity code for 'mycontract', which includes a 'getZoneName' function that returns 'Zone name'. The bottom right pane shows the 'CALL' details for the transaction, including the 'from' address, 'to' address, 'execution cost' (715 gas), 'input' data, 'decoded input' (empty array), 'decoded output' (array containing 'Zone name'), and 'logs' (empty array).
